

$$\eta_b = 100\%$$

$$\eta_{\text{moteur}} = 30\%$$

$$\eta_g = 67,9\%$$

Données de départ (CdC)

$$\eta_m = \frac{P_{m \text{ m\u00e9ca}}}{P_{m \text{ \u00e9lec}}}$$

$$P_{m \text{ \u00e9lec}} = \frac{P_{m \text{ m\u00e9ca}}}{\eta_{b \text{ m}}}$$

$$\omega_m = \frac{\omega_b}{z}$$

$$\omega_m \approx 415 \text{ rad/s}$$

$$\left(z = \frac{\omega_s}{\omega_e} \right)$$

$$C_b = 50 \text{ N.cm} \approx 0,5 \text{ N.m}$$

$$N_b = 3 \text{ tr/min}$$

$$\omega_b \approx 0,314 \text{ rad/s}$$

$$(P = U \cdot I)$$

$$P_{m \text{ \u00e9lec}} \approx 0,77 \text{ W}$$

$$(P = C \cdot \omega)$$

$$P_m = \frac{P_b}{\eta_g}$$

$$= 0,231 \text{ W}$$

$$\left(\eta_g = \frac{P_s}{P_e} \right)$$

$$\eta_{bg} = \frac{P_b}{P_m}$$

$$P_b = 0,5 \cdot 0,314 = 0,157 \text{ W}$$

$$P_{m \text{ \u00e9lec}} = U_m \cdot I_m$$

$$I_m = \frac{P_{m \text{ \u00e9lec}}}{U_m}$$

$$I_m \approx 0,257 \text{ A}$$

$$\approx 5,57 \cdot 10^{-4} \text{ N.m}$$

Calcul autonomie pile R20 D: $U_p = 3V$ $I_p = 0,257A_{2/3}$

$$P_p = 0,77W$$

Capacité : $Q_{pile} = 18000 mAh$

$$\underset{Wh}{E} = \underset{W}{P} \cdot \underset{h}{\Delta t}$$

$$\underset{Ah}{Q_{batt}} = \underset{A}{I} \cdot \underset{h}{\Delta t}$$

donc

$$\Delta t = \frac{Q_{batt}}{I}$$

$$\Delta t = \frac{18}{0,257} \approx 70h$$

$$\underset{Wh}{E_{elec}} = \underset{W}{P_{elec}} \cdot \underset{h}{\Delta t}$$

$$\underset{Wh}{E_{elec}} = \underset{V}{U} \cdot \underset{A}{I} \cdot \underset{h}{\Delta t}$$

$$\underset{Wh}{E_{batt}} = \underset{V}{U_{batt}} \cdot \underset{Ah}{Q_{batt}}$$

$$U_{\text{résistif}} = F \cdot d$$

$$= 1,5 \cdot 5 \cdot 10^{-3}$$

$$U \approx 7,5 \cdot 10^{-3} \text{ Nm}$$
